LOADING: GETTING YOUR DATA INTO PYHYPERSCATTERING

CHAPTER	
TWO	

INTEGRATION: RAW INTENSITY TO I(Q)

PyHyperScattering, Release 0+unknown	
jjpereeantering, recentee et annieum	_

THREE

LEARNING TO FLY

From this point, you're in a place where the next steps largely depend on the analysis you want to do with your data.

The tools and language are that of the xarray package, so the main goal of this section is to teach you just enough xarray to have a vocabulary for converting scientific lines of thought into commands and visualize/dissect the results.

The most important command, by far, is select or .sel

FOUR

UTILITY MODULES

Despite the power of writing your own analyses, it seems likely that many of the analyses you'll want to do won't actually be that novel.

To that end, we furnish two modules of 'canned' approaches: RSoXS and fitting. User contributions are encouraged in this area.

4.1 RSoXS

4.2 Fitting

PyHyperScattering aims to make working with hyperspectral x-ray and neutron scattering data easy, to make programs that work with such data a combination of simple, logical commands with minimal 'cruft'. In the era of modern computing, there is no reason you should have to think about for loops and how you're storing different intermediate data products - you should be able to go immediately from raw data to an analysis with clear commands, punch down to the data you need for your science quickly. The goal is for these tools to make the mechanics of hyperspectral scattering easier and in so doing, more reproducible, explainable, and robust.

It grew out of the NIST RSoXS program, but aims to be broadly applicable. If it's scattering data, you should be able to load it, reduce it, and slice it.

Run tutorials using Binder:

The tools PyHyper provides are basically divided into three categories:

FIVE

LOADING DATA

Get your data from a source - files on disk or a network connection to a DataBroker or whatever - into a standardized structure we call a raw xarray. The metadata should be loaded and converted to a standardized set of terms, intensity corrections applied, and the frames stacked along whatever dimensions you want.

10

SIX

INTEGRATION

Convert your data from pixel space or qx/qy space to chi-q space - perfect for slicing. generally tools here are built on pyFAI, though some variants also use warp_polar from numpy.

CHAPTER
SEVEN

CUSTOM ANALYSIS

Slice your data along specified dimensions and visualize the results.

EIGHT

UTILITIES

These are pre-canned routines for common analyses, such as RSoXS anisotropic ratio or peak/background fitting. the intent here is that the barrier to building your own code is low, and contributions in module space are especially welcomed and encouraged.

Have fun!

16 Chapter 8. Utilities

СНАРТЕ	:R
NINI	Ε

USER GUIDE

Work in progress cookbook for specific tasks.

TEN

API REFERENCE

10.1 PyHyperScattering package

10.1.1 Submodules

10.1.2 PyHyperScattering.load module

PyHyperScattering.load.FileLoader module

class PyHyperScattering.load.FileLoader

Bases: object

Abstract class defining a generic scattering file loader. Input is a (or multiple) filename/s and output is a xarray I(pix_x,pix_y,dims,coords) where dims and coords are loaded by user request.

Difference: all coords are dims but not all dims are coords. Dims can also be auto-hinted using the following standard names: energy,exposure,pos_x,pos_y,pos_z,theta.

Individual loaders can try searching metadata for other dim names but this is not guaranteed. Coords can be used to provide a list of values for a dimension when that dimension cannot be hinted, e.g. where vals come from external data.

```
file_ext = ''
```

Load a series into a single xarray.

• = not implemented yet

Parameters

- **basepath** (*str or Path*) path to the directory to load
- dims (list) dimensions of the resulting xarray (excluding 'pix_x' and 'pix_y'), as list
 of str
- \bullet **coords** (dict) dictionary of any dims that are *not* present in metadata
- **file_filter** (*str*) string that must be in each file name
- *file_filer_regex (str) regex string that must match in each file name
- *file_skip (str) string that, if present in file name, means file should be skipped.

- md_filter (dict) dict of required metadata values; points without these metadata values will be dropped
- md_filter_regex (dict) dict of required metadata regex; points without these metadata values will be dropped
- quiet (bool) skip printing most intermediate output if true.
- **output_qxy** (*bool*) output a qx/qy stack rather than a pix_x/pix_y stack. This is a lossy operation, the array will be remeshed. Not recommended.
- output_raw (bool) Do not apply pixel or q coordinates to the final stack.
- **dest_qx** (*array-like or None*) set of qx points that you would like the final stack to have. If None, will take the middle image and remesh to that.
- **dest_qy** (*array-like or None*) set of qy points that you would like the final stack to have. If None, will take the middle image and remesh to that.
- **image_slice** (*tuple of slices*) If provided, all images will be reduced according to these slice objects

loadSingleImage(filepath, coords=None, return_q=None, **kwargs)

```
md_loading_is_quick = False
```

peekAtMd(filepath)

PyHyperScattering.load.ALS11012RSoXSLoader module

Bases: FileLoader

Loader for FITS files from the ALS 11.0.1.2 RSoXS instrument

Additional requirement: astropy, for FITS file loader

Usage is mainly via the inherited function integrateImageStack from FileLoader

```
file_ext = '(.*?).fits'
```

loadDarks(basepath, dark_base_name)

Load a series of dark images as a function of exposure time, to be subtracted from subsequently-loaded data.

Parameters

- basepath (str or Path) path to load images from
- dark_base_name (str) str that must be in file for file to be a dark

loadSampleSpecificDarks(basepath, file_filter="', file_skip='donotskip', md_filter={})

load darks matching a specific sample metadata

Used, e.g., to load darks taken at a time of measurement in order to improve the connection between the dark and sample data.

Parameters

- **basepath** (*str*) path to load darks from
- **file_filter** (*str*) string that must be in each file name
- **file_skip** (*str*) string that, if in file name, means file should be skipped.
- **md_filter** (*dict*) dict of required metadata values. this will be appended with dark images only, no need to put that here.

loadSingleImage(filepath, coords=None, return_q=False, **kwargs)

THIS IS A HELPER FUNCTION, mostly - should not be called directly unless you know what you are doing

Load a single image from filepath and return a single-image, raw xarray, performing dark subtraction if so configured.

```
md_loading_is_quick = True
```

normalizeMetadata(headerdict)

convert the local metadata terms in headerdict to standard nomenclature

Parameters

headerdict (*dict*) – the header returned by the file loader

peekAtMd(file)

load the header/metadata without opening the corresponding image

Parameters

file (*str*) – fits file from which to load metadata

PyHyperScattering.load.SST1RSoXSLoader module

Bases: FileLoader

Loader for TIFF files from NSLS-II SST1 RSoXS instrument

```
file_ext = '(.*?)primary(.*?).tiff'
```

loadMd(filepath)

HELPER FUNCTION that loads a single image and returns an xarray with either pix_x / pix_y dimensions (if return_q == False) or qx / qy (if return_q == True)

Parameters

- **filepath** (Pathlib.path) path of the file to load
- **coords** (*dict-like*) coordinate values to inject into the metadata
- return_q (bool) return qx / qy coords. If false, returns pixel coords.

```
md_loading_is_quick = True
```

peekAtMd(filepath)

```
pix_size_1 = 0.06
pix_size_2 = 0.06
read_baseline(baseline_csv)
read_json(jsonfile)
read_primary(primary_csv, seq_num, cwd)
read_shutter_toggle(shutter_csv)
```

PyHyperScattering.load.SST1RSoXSDB module

```
background()
do_list_append(**kwargs)
file_ext = ''
loadMd(run)
```

return a dict of metadata entries from the databroker run xarray

```
loadMonitors(entry, integrate_onto_images: bool = True, useShutterThinning: bool = True, n\_thinning\_iters: int = 5)
```

Load the monitor streams for entry.

Creates a dataset containing all monitor streams (e.g., Mesh Current, Shutter Timing, etc.) as data variables mapped against time. Optionally, all streams can be indexed against the primary measurement time for the images using integrate_onto_images. Whether or not time integration attempts to account for shutter opening/closing is controlled by useShutterThinning. Warning: for exposure times < 0.5 seconds at SST (as of 9 Feb 2023), useShutterThinning=True may excessively cull data points.

Parameters

- **entry** (databroker.client.BlueskyRun) Bluesky Document containing run information. ex: phs.load.SST1RSoXSDB.c[scanID] or databroker.client.CatalogOfBlueskyRuns[scanID]
- **integrate_onto_images** (*bool*, *optional*) whether or not to map timepoints to the image measurement times (as held by the 'primary' stream), by default True Presently bins are averaged between measurements intervals.
- useShutterThinning (boo1, optional) Whether or not to attempt to thin (filter) the raw time streams to remove data collected during shutter opening/closing, by default False As of 9 Feb 2023 at NSLS2 SST1, using useShutterThinning= True for exposure times of < 0.5s is not recommended because the shutter data is unreliable and too many points will be culled
- **n_thinning_iters** (*int*, *optional*) how many iterations of thinning to perform, by default 5 If the data is becoming too sparse, try fewer iterations

Returns

xarray dataset containing all monitor streams as data variables mapped against the dimension "time"

Return type

xr.Dataset

loadRun(run, dims=None, coords={}, return_dataset=False, useMonitorShutterThinning=True)

Loads a run entry from a catalog result into a raw xarray.

Parameters

- run (DataBroker result, int of a scan id, list of scan ids, list of DataBroker runs) a single run from BlueSky
- **dims** (*list*) list of dimensions you'd like in the resulting xarray. See list of allowed dimensions in documentation. If not set or None, tries to auto-hint the dims from the RSoXS plan_name.
- **CHANGE** List of dimensions you'd like. If not set, will set all possibilities as dimensions (x, y, theta, energy, polarization)
- **coords** (*dict*) user-supplied dimensions, see syntax examples in documentation.
- **return_dataset** (*bool*, *default False*) return both the data and the monitors as a xr.dataset. If false (default), just returns the data.

Returns

raw xarray containing your scan in PyHyper-compliant format

Return type

raw (xarray)

loadSeries(run_list, meta_dim, loadrun_kwargs={})

Loads a series of runs into a single xarray object, stacking along meta_dim.

Useful for a set of samples, or a set of polarizations, etc., taken in different scans.

Parameters

- run_list (list) list of scan ids to load
- **meta_dim** (*str*) dimension to stack along. must be a valid attribute/metadata value, such as polarization or sample_name

Returns

xarray.Dataset with all scans stacked

Return type

raw

loadSingleImage(*filepath*, *coords=None*, *return_q=False*, **kwargs)

DO NOT USE

This function is preserved as reference for the qx/qy loading conventions.

NOT FOR ACTIVE USE. DOES NOT WORK.

```
md_loading_is_quick = True
```

```
md_lookup = {'energy': 'en_energy_setpoint', 'exposure': 'RSoXS Shutter Opening
Time (ms)', 'polarization': 'en_polarization_setpoint', 'sam_th': 'RSoXS Sample
Rotation', 'sam_x': 'RSoXS Sample Outboard-Inboard', 'sam_y': 'RSoXS Sample
Up-Down', 'sam_z': 'RSoXS Sample Downstream-Upstream'}
```

```
md_secondary_lookup = {'energy': 'en_monoen_setpoint'}
peekAtMd(run)
pix_size_1 = 0.06
pix_size_2 = 0.06
runSearch(**kwargs)
    Search the catalog using given commands.
        Parameters
            **kwargs – passed through to the RawMongo search method of the catalog.
```

a catalog result object

Return type

result (obj)

```
searchCatalog(outputType: str = 'default', cycle: str = None, proposal: str = None, saf: str = None, user:
                  str = None, institution: str = None, project: str = None, sample: str = None, sampleID: str = None
                  None, plan: str = None, userOutputs: list = [], debugWarnings: bool = False, **kwargs) \rightarrow
                  DataFrame
```

Search the Bluesky catalog for scans matching all provided keywords and return metadata as a dataframe.

Matches are made based on the values in the top level of the 'start' dict within the metadata of each entry in the Bluesky Catalog (databroker.client.CatalogOfBlueskyRuns). Based on the search arguments provided, a pandas dataframe is returned where rows correspond to catalog entries (scans) and columns contain metadata. Several presets are provided for choosing which columns are generated, along with an interface for user-provided search arguments and additional metadata. Fails gracefully on bad user input/ changes to underlying metadata scheme.

Ex1: All of the carbon, fluorine, or oxygen scans for a single sample series in the most recent cycle: bsCatalogReduced4 = db_loader.searchCatalog(sample="bBP_", institution="NIST", cycle = "2022-2", plan="carbon|fluorine|oxygen")

Ex2: Just all of the scan Ids for a particular sample:

bsCatalogReduced4 = db_loader.searchCatalog(sample="BBP_PFP09A", outputType='scans')

Ex3: Complex Search with custom parameters

```
db_loader.searchCatalog(['angle',
                                                                '-1.6',
bsCatalogReduced3
                                                                           'numeric'],
                                                                                          output-
Type='all',sample="BBP_", cycle = "2022-2", institution="NIST",plan="carbon", userOutputs
= [["Exposure Multiplier", "exptime", r'catalog.start'], ["Stop Time", "time", r'catalog.stop']])
```

Parameters

- outputType (str, optional) modulates the content of output columns in the returned dataframe 'default' returns scan id, start time, cycle, institution, project, sample name, sample_id, plan name, detector, polarization, exit_status, and num_images 'scans' returns only the scan ids (1-column dataframe) 'ext msmt' returns default columns AND bar spot, sample rotation 'ext bio' returns default columns AND uid, saf, user name 'all' is equivalent to 'default' and all other additive choices
- cycle (str, optional) NSLS2 beamtime cycle, regex search e.g., "2022" matches "2022-2", "2022-1"
- proposal (str, optional) NSLS2 PASS proposal ID, case-insensitive, exact match, e.g., "GU-310176"

- **saf** (*str*, *optional*) Safety Approval Form (SAF) number, exact match, e.g., "309441"
- **user** (*str*, *optional*) User name, case-insensitive, regex search e.g., "eliot" matches "Eliot", "Eliot Gann"
- **institution** (*str*, *optional*) Research Institution, case-insensitive, exact match, e.g., "NIST"
- **project** (*str*, *optional*) Project code, case-insensitive, regex search, e.g., "liquid" matches "Liquids", "Liquid-RSoXS"
- **sample** (*str*, *optional*) Sample name, case-insensitive, regex search, e.g., "BBP_" matches "BBP PF902A"
- **sampleID** (*str*, *optional*) Sample ID, case-insensitive, regex search, e.g., "BBP_" matches "BBP PF902A"
- plan (str, optional) Measurement Plan, case-insensitive, regex search, e.g., "Full" matches "full_carbon_scan_nd", "full_fluorine_scan_nd" e.g., "carbon|oxygen|fluorine" matches carbon OR oxygen OR fluorine scans
- **kwargs Additional search terms can be provided as keyword args and will further filter the catalog Valid input follows metadataLabel='searchTerm' or metadataLavel = ['searchTerm', 'matchType']. Metadata labels must match an entry in the 'start' dictionary of the catalog. Supported match types are combinations of 'case-insensitive', 'case-sensitive', and 'exact' OR 'numeric'. Default behavior is to do a case-sensitive regex match. For metadata labels that are not valid python names, create the kwarg dict before passing into the function (see example 3). Additional search terms will appear in the output data columns. Ex1: passing in cycle='2022' would match 'cycle'='2022-2' AND 'cycle='2022-1' Ex2: passing in grazing=[0,'numeric'] would match grazing==0 Ex3: create kwargs first, then pass it into the function.

kwargs = {'2weird metadata label': "Bob", 'grazing': 0, 'angle':-1.6} db_loader.searchCatalog(sample="BBP_PFP09A", outputType='scans', **kwargs)

- userOutputs (list of lists, optional) Additional metadata to be added to output can be specified as a list of lists. Each sub-list specifies a metadata field as a 3 element list of format: [Output column title (str), Metadata label (str), Metadata Source (raw str)], Valid options for the Metadata Source are any of [r'catalog.start', r'catalog.start["plan_args"], r'catalog.stop', r'catalog.stop["num_events"]'] e.g., userOutputs = [["Exposure Multiplier", "exptime", r'catalog.start'], ["Stop Time", "r'catalog.stop']]
- **debugWarnings** (*bool*, *optional*) if True, raises a warning with debugging information whenever a key can't be found.

Returns

Pandas dataframe containing the results of the search, or an empty dataframe if the search fails

summarize_run(*args, **kwargs)

Deprecated function for searching the bluesky catalog for a run. Replaced by searchCatalog()

To be removed in PyHyperScattering 1.0.0+.

PyHyperScattering.load.cyrsoxsLoader module

Bases: object

Loader for cyrsoxs simulation files

This code is modified from Dean Delongchamp.

```
file_ext = 'config.txt'
```

loadDirectory(*directory*, *method=None*, **kwargs)

loadDirectoryDask(directory, output_dir='HDF5', morphology_file=None, PhysSize=None)

Loads a CyRSoXS simulation output directory into a Dask-backed qx/qy xarray.

Parameters

- **directory** (*string or Path*) root simulation directory
- output_dir (string or Path, default /HDF5) directory relative to the base to look for hdf5 files in.

loadDirectoryLegacy(directory, output_dir='HDF5', morphology_file=None, PhysSize=None)

Loads a CyRSoXS simulation output directory into a qx/qy xarray.

Parameters

- **directory** (*string or Path*) root simulation directory
- output_dir (string or Path, default /HDF5) directory relative to the base to look for hdf5 files in.

```
md_loading_is_quick = False
```

read_config(fname)

Reads config.txt from a CyRSoXS simulation and produces a dictionary of values.

Parameters

fname (string or Path) – path to file

Returns

dict representation of config file

Return type

config

10.1.3 PyHyperScattering.integrate module

PyHyperScattering.integrate.PFEnergySeriesIntegrator module

```
class PyHyperScattering.PFEnergySeriesIntegrator.PFEnergySeriesIntegrator(**kwargs)
```

Bases: PFGeneralIntegrator

createIntegrator(en, recreate=False)

integrateImageStack(img_stack, method=None, chunksize=None)

```
integrateImageStack_dask(img_stack, chunksize=5)
integrateImageStack_legacy(img_stack)
integrateSingleImage(img)
recreateIntegrator()
    recreate the integrator, after geometry change
setupDestQ(energies)
setupIntegrators(energies)
```

Sets up the integrator stack as a function of energy.

The final statement ensures that the integrator for the median of the set is created. This integrator is used to set the output q-binning.

Details: (copied from a message)

The fact that energy is changing during reduction means that if not forced to something, the output q bins of the integrator will move as well (since the pixel to q mappings are moving with energy). Because sparse data in q is a nightmare, we pick a given set of q bins corresponding to the median of the energies in the scan. That is a compromise between a few approaches. This line manually creates that integrator with default q binning settings so we can take those bins and tell all the other integrators to use that output q grid.

It would cosmically be better (for things like resolution calculation) to have the q bins actually move, but sparse arrays are computationally hard. Eventually (2-3 years of high performance Python evolution) I think that will be the right way to do it, this is an intermediate.

PyHyperScattering.PFEnergySeriesIntegrator.inner_generator(df_function='apply')

PyHyperScattering.integrate.PFGeneralIntegrator module

class PyHyperScattering.PFGeneralIntegrator.PFGeneralIntegrator(maskmethod='none',

maskrotate=True,
geomethod='none',
NIdistance=0, NIbcx=0,
NIbcy=0, NItiltx=0, NItilty=0,
NIpixsizex=0, NIpixsizey=0,
template_xr=None,
ponifile=None, energy=2000,
integration_method='csr_ocl',
correctSolidAngle=True,
maskToNan=True, npts=500,
use_log_ish_binning=False,
do_ld_integration=False,
return_sigma=False,
use_chunked_processing=False,
**kwargs)

Bases: object

PyFAI general integrator wrapper

calibrationFromNikaParams(distance, bcx, bcy, tiltx, tilty, pixsizex, pixsizey)

DEPRECATED as of 0.2

Set the local calibrations using Nika parameters.

this will probably only support rotations in the SAXS limit (i.e., where $sin(x) \sim x$, i.e., a couple degrees) since it assumes the PyFAI and Nika rotations are about the same origin point (which I think isn't true).

Args:

distance: sample-detector distance in mm bcx: beam center x in pixels bcy: beam center y in pixels tiltx: detector x tilt in deg, see note above tilty: detector y tilt in deg, see note above pixsizex: pixel size in x, microns pixsizey: pixel size in y, microns

calibrationFromPoniFile(ponifile)

Sets calibration from a pyFAI poni-file

Parameters

- ponifile (str or Pathlib.path) a pyFAI poni file containing the geometry
- raw_xr (raw format xarray) optional, raw xr with correct pixel dimensions for creating an empty mask if necessary

calibrationFromTemplateXRParams(raw_xr)

Sets calibration from a pyFAI values in a template xarray

Parameters

raw_xr (raw format xarray) - a raw_xr bearing the metadata in members

property energy

integrateImageStack(img_stack, method=None, chunksize=None)

integrateImageStack_dask(data, chunksize=5)

integrateImageStack_legacy(data)

integrateSingleImage(img)

loadEdfMask(**kwargs)

Loads an edf-format mask (probably from pyFAI.calib2?).

Parameters

filetoload (pathlib.Path or string) - path to edf format mask

loadImageMask(**kwargs)

loads a mask from a generic image

Parameters

- maskpath ((pathlib.Path or String)) path to load
- maskrotate ((bool)) rotate mask using np.flipud(np.rot90(mask))

loadNikaMask(rotate_image=True, **kwargs)

Loads a Nika-generated HDF5 or tiff mask and converts it to an array that matches the local conventions.

Parameters

- **filetoload** (pathlib.Path or string) path to hdf5/tiff format mask from Nika.
- rotate_image (bool, default True) rotate image as should work

```
loadPolyMask(maskpoints=[], **kwargs)
     loads a polygon mask from a list of polygon points
     Args: (list) maskpoints: a list of lists of points, e.g.
         ſ
             [ #begin polygon 1
               [0,0],[0,10],[10,10],[10,0]
             ], [ #later polygons]
         1
     (tuple) maskshape: (x,y) dimensions of mask to create
         if not passed, will assume that the maximum point is included in the mask
loadPyHyperMask(**kwargs)
     Loads a mask json file saved by PyHyper's drawMask routines.
             maskpath ((pathlib.Path or string)) – path to load json file from
property ni_beamcenter_x
property ni_beamcenter_y
property ni_distance
property ni_pixel_x
property ni_pixel_y
property ni_tilt_x
property ni_tilt_y
recreateIntegrator()
     recreate the integrator, after geometry change
property wavelength
```

PyHyperScattering.PFGeneralIntegrator.inner_generator(df function='apply')

PyHyperScattering.integrate.WPIntegrator module

Integrator for qx/qy format xarrays using skimage.transform.warp_polar or a custom cuda-accelerated version, warp_polar_gpu

10.1.4 PyHyperScattering.util module

PyHyperScattering.util.Fitting module

PyHyperScattering.util.HDR module

PyHyperScattering.util.IntegrationUtils module

PyHyperScattering.util.FileIO module

PyHyperScattering.util.RSoXS module

10.1.5 Module contents

ELEVEN

DEVELOPMENT AND CONTRIBUTING INFO

11.1 Scope and Package Outline

PyHyperScattering is a Python package for analyzing hyperspectral scattering data - that is, x-ray and neutron scattering data that is assessed as a series rather than as a set of discrete, disconnected points.

The package is designed to provide useful tooling for end-to-end analysis using the XArray package, emphasizing the translation of bespoke, instrument-specific parameters to a common, interoperable XArray format. The package is designed to be modular and extensible, with a focus on the following key areas of data analysis:

- 1. Data Import and Translation "loading" (PyHyperScattering.load): Importing and translating raw data from a variety of sources into a common format. Individual loaders are provided for a variety of instruments and a variety of input formats; tooling in PyHyperScattering.load.FileLoader provides a prototype for quickly building new file-based loaders by providing only an image loading function and a metadata loading function. Intensity corrections, where possible, are applied in the loading stage.
- 2. Data Reduction "integration" (PyHyperScattering.integrate): Reduction of raw data to a common format of I(q,chi) or in some cases I(qx,qy). We endeavor to use other, high-quality, community supported reduction engines such as PyFAI, PyGIX, and scikit-image warp_polar.
- 3. Utility Modules "util": A collection of utility modules for such tasks as file input/output, beam centering and masking, and other common tasks.
- 4. Bespoke analyses "rsoxs" and others: A collection of bespoke analyses for specific measurement techniques. These analyses are intended to be a 'cookbook' of common recipes for users to build their own scientific data pipelines.

PyHyperScattering is unapologetically API-first, a library rather than a program. We enforce a strict separation of scientific logic code from user interfaces. This is a choice to provide the code with the best possible chance to be reused in new ways not anticipated by the original development. For instance, a data loading and reduction routine might be used in a Jupyter notebook, dispatched from a shell script, used to back a webapp using a framework like NiceGUI, used at-scale to reduce all data from a beamline via Prefect, etc. By separating UI from science, we make it possible to have the same well-tested code back all these applications.

Placeholder page.

Placeholder page.

11.2 Scope and Package Outline

We consider in-scope any aspect of loading, reduction, and analysis of hyperspectral scattering data. Details are at <scope>.

11.3 Development Philosophy

The PyHyperScattering package is designed to be modular and extensible. Our general philosophy is to accept contributions that don't break existing user experiences and don't impose too large of a documentation burden. Details at <philosophy>.

11.4 Key API Concepts / Abstract Classes

The API is built around formalized interfaces of XArrays between Loader, Integrator, and Analysis classes. Details at <api_concepts>.

11.5 Contributing

Contributions are welcome! Please view our Contributor Guidelines on github.

Permission in the United States and in foreign countries, to the extent that NIST may hold copyright, to use, copy, modify, create derivative works, and distribute this software and its documentation without fee is hereby granted on a non-exclusive basis, provided that this notice and disclaimer of warranty appears in all copies. THE SOFTWARE IS PROVIDED 'AS IS' WITHOUT ANY WARRANTY OF ANY KIND, EITHER EXPRESSED, IMPLIED, OR STATUTORY, INCLUDING, BUT NOT LIMITED TO, ANY WARRANTY THAT THE SOFTWARE WILL CONFORM TO SPECIFICATIONS, ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, AND FREEDOM FROM INFRINGEMENT, AND ANY WARRANTY THAT THE DOCUMENTATION WILL CONFORM TO THE SOFTWARE, OR ANY WARRANTY THAT THE SOFT-WARE WILL BE ERROR FREE. IN NO EVENT SHALL NIST BE LIABLE FOR ANY DAMAGES, INCLUDING, BUT NOT LIMITED TO, DIRECT, INDIRECT, SPECIAL OR CONSEQUENTIAL DAMAGES, ARISING OUT OF, RESULTING FROM, OR IN ANY WAY CONNECTED WITH THIS SOFTWARE, WHETHER OR NOT BASED UPON WARRANTY, CONTRACT, TORT, OR OTHERWISE, WHETHER OR NOT INJURY WAS SUSTAINED BY PERSONS OR PROPERTY OR OTHERWISE, AND WHETHER OR NOT LOSS WAS SUSTAINED FROM, OR AROSE OUT OF THE RESULTS OF, OR USE OF, THE SOFTWARE OR SERVICES PROVIDED HEREUNDER. With respect to the example data package, the following terms apply: The data/work is provided by NIST as a public service and is expressly provided "AS IS." NIST MAKES NO WARRANTY OF ANY KIND, EXPRESS, IMPLIED OR STATUTORY, INCLUDING, WITHOUT LIMITATION, THE IMPLIED WARRANTY OF MERCHANTABIL-ITY, FITNESS FOR A PARTICULAR PURPOSE, NON-INFRINGEMENT AND DATA ACCURACY. NIST does not warrant or make any representations regarding the use of the data or the results thereof, including but not limited to the correctness, accuracy, reliability or usefulness of the data. NIST SHALL NOT BE LIABLE AND YOU HEREBY RELEASE NIST FROM LIABILITY FOR ANY INDIRECT, CONSEQUENTIAL, SPECIAL, OR INCIDENTAL DAMAGES (INCLUDING DAMAGES FOR LOSS OF BUSINESS PROFITS, BUSINESS INTERRUPTION, LOSS

OF BUSINESS INFORMATION, AND THE LIKE), WHETHER ARISING IN TORT, CONTRACT, OR OTHER-WISE, ARISING FROM OR RELATING TO THE DATA (OR THE USE OF OR INABILITY TO USE THIS DATA), EVEN IF NIST HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES. To the extent that NIST may hold copyright in countries other than the United States, you are hereby granted the non-exclusive irrevocable and unconditional right to print, publish, prepare derivative works and distribute the NIST data, in any medium, or authorize others to do so on your behalf, on a royalty-free basis throughout the world. You may improve, modify, and create derivative works of the data or any portion of the data, and you may copy and distribute such modifications or works. Modified works should carry a notice stating that you changed the data and should note the date and nature of any such change. Please explicitly acknowledge the National Institute of Standards and Technology as the source of the data: Data citation recommendations are provided at https://www.nist.gov/open/license. Permission to use this data is contingent upon your acceptance of the terms of this agreement and upon your providing appropriate acknowledgments of NIST's creation of the data/work.

RELEASE NOTES

Release notes for each release are on the *GitHub releases page <https://github.com/usnistgov/PyHyperScattering/releases>* Major changes are discussed here:

Preparing for v1.0 release, which includes breaking changes that make xarray Datasets the underlying data structure.

THIRTEEN

ABOUT

PyHyperScattering aims to make working with hyperspectral x-ray and neutron scattering data easy" to make programs that work with such data a combination of simple, logical commands with minimal 'cruft'. In the era of modern computing, there is no reason you should have to think about for loops and how you're storing different intermediate data products - you should be able to go immediately from raw data to an analysis with clear commands, punch down to the data you need for your science quickly. The goal is for these tools to make the mechanics of hyperspectral scattering easier and in so doing, more reproducible, explainable, and robust.

PyHyperScattering is an open-source collaboration maintained by the National Institute of Standards and Technology (NIST). This package is under active development, and the team welcome DMs with questions on the NIST RSoXS slack, Nikea, and NSLS2 slack channels, or by email to Dr. Peter Beaucage. For more information about contributing, development philosophy, and licensing, see *the Development page*.

38 Chapter 13. About

FOURTEEN

DOCUMENTATION

Getting Started Tutorials to help you get your analysis up and running. Beginners should start here.

API Reference Detailed technical reference; presents documentation at the function, class, and module level.

User Guide A collection of How-To guides (recipes) for specific data reduction, analysis, and visualization tasks. *Development* Information and resources regarding the scope and development philosophy of this project, along with information on contributing and licensing.
